T-NSA-500

# What is PostgreSQL?

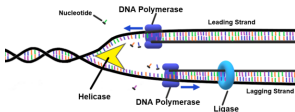

PostgreSQL is an extensible and compliant database management system. It supports both SQL and JSON, for relational and non-relational queries.

It supports advanced data types and has performance optimization features, which are only available in expensive commercial databases, like Oracle and SQL Server.

# Replication

Replication is the process of copying and storing data in multiple locations.

The process can be one-off or continuous, depending on the requirements. The latter ensures the replicated data is regularly updated and consistent.

Native features of postgresql allow replication.

# Questions
